TracBack on Automotive Devices

TracBack is a feature that allows the user to return along a traveled path or route without marking any waypoints. The GPS device will store a tracklog or "electronic breadcrumb trail" as it moves. The device will look at hundreds or thousands of tracklog points. It will take the 30 most significant and turn them into a route to get back to the starting point.

To access this feature you will need an active track log present on your device:

1. Touch **Where To?**
 - Touch **Apps** on some devices
2. Touch the **down arrow** until you see TracBack
3. Touch **TracBack**
